Abstract: Let $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$ and $(\{g_k\}_{k=1}^n, \{\omega_k\}_{k=1}^n)$ be two p-orthonormal bases for a finite dimensional Banach space X. Let $M, N \subseteq \{1, ..., n\}$ be such that

$$
o(M)^{\frac{1}{q}}o(N)^{\frac{1}{p}} < \frac{1}{\max_{1 \le j,k \le n} |g_k(\tau_j)|},
$$

where q is the conjugate index of p. Then for all $x \in \mathcal{X}$, we show that

$$
(1) \qquad ||x|| \leq \left(1 + \frac{1}{1 - o(M)^{\frac{1}{q}} o(N)^{\frac{1}{p}} \max_{1 \leq j,k \leq n} |g_k(\tau_j)|}\right) \left[\left(\sum_{j \in M^c} |f_j(x)|^p\right)^{\frac{1}{p}} + \left(\sum_{k \in N^c} |g_k(x)|^p\right)^{\frac{1}{p}}\right].
$$

We call Inequality [\(1\)](#page-0-0) as **Functional Ghobber-Jaming Uncertainty Principle**. Inequality (1) improves the uncertainty principle obtained by Ghobber and Jaming *[Linear Algebra Appl., 2011]*. Keywords: Uncertainty Principle, Orthonormal Basis, Hilbert space, Banach space. Mathematics Subject Classification (2020): 42C15, 46B03, 46B04.

CONTENTS

1. INTRODUCTION

Let $d \in \mathbb{N}$ and $\hat{C}: \mathcal{L}^2(\mathbb{R}^d) \to \mathcal{L}^2(\mathbb{R}^d)$ be the unitary Fourier transform obtained by extending uniquely the bounded linear operator

$$
\widehat{}: \mathcal{L}^1(\mathbb{R}^d) \cap \mathcal{L}^2(\mathbb{R}^d) \ni f \mapsto \widehat{f} \in C_0(\mathbb{R}^d); \quad \widehat{f} : \mathbb{R}^d \ni \xi \mapsto \widehat{f}(\xi) := \int_{\mathbb{R}^d} f(x) e^{-2\pi i \langle x, \xi \rangle} dx \ \in \mathbb{C}.
$$

In 2007, Jaming [\[4\]](#page-6-1) extended the uncertainty principle obtained by Nazarov for $\mathbb R$ in 1993 [\[8\]](#page-6-2) (cf. [\[3\]](#page-6-3)). In the following theorem, Lebesgue measure on \mathbb{R}^d is denoted by m. Mean width of a measurable subset E of \mathbb{R}^d having finite measure is denoted by $w(E)$.

Theorem 1.1. [\[4,](#page-6-1) [8\]](#page-6-2) (Nazarov-Jaming Uncertainty Principle) For each $d \in \mathbb{N}$, there exists a *universal constant* C_d (depends upon d) satisfying the following: If $E, F \subseteq \mathbb{R}^d$ are measurable subsets *having finite measure, then for all* $f \in \mathcal{L}^2(\mathbb{R}^d)$,

$$
(2) \qquad \int_{\mathbb{R}^d} |f(x)|^2 dx \leq C_d e^{C_d \min\{m(E)m(F), m(E)^{\frac{1}{d}}w(F), m(F)^{\frac{1}{d}}w(E)\}} \qquad \left[\int_{E^c} |f(x)|^2 dx + \int_{F^c} |\widehat{f}(\xi)|^2 d\xi \right].
$$

In particular, if f is supported on E and f is supported on F, then $f = 0$.

Theorem [1.1](#page-0-2) and the milestone paper [\[1\]](#page-6-4) of Donoho and Stark which derived finite dimensional uncertainty principles, motivated Ghobber and Jaming [\[2\]](#page-6-5) to ask what is the exact finite dimensional analogue of Theorem [1.1?](#page-0-2) Ghobber and Jaming were able to derive the following beautiful theorem. Given a subset $M \subseteq \{1, \ldots, n\}$, the number of elements in M is denoted by $o(M)$.

Theorem 1.2. [\[2\]](#page-6-5) (**Ghobber-Jaming Uncertainty Principle**) Let ${\lbrace \tau_j \rbrace}_{j=1}^n$ and ${\lbrace \omega_j \rbrace}_{j=1}^n$ be orthonor*mal bases for the Hilbert space* \mathbb{C}^n *. If* $M, N \subseteq \{1, ..., n\}$ *are such that*

(3)
$$
o(M)o(N) < \frac{1}{\max_{1 \le j,k \le n} |\langle \tau_j, \omega_k \rangle|^2},
$$

then for all $h \in \mathbb{C}^n$,

$$
\|h\| \leq \left(1 + \frac{1}{1-\sqrt{o(M)o(N)}\max\limits_{1\leq j,k\leq n}|\langle\tau_j,\omega_k\rangle|}\right)\left[\left(\sum\limits_{j\in M^c}|\langle h,\tau_j\rangle|^2\right)^{\frac{1}{2}} + \left(\sum\limits_{k\in N^c}|\langle h,\omega_k\rangle|^2\right)^{\frac{1}{2}}\right].
$$

In particular, if h *is supported on* M *in the expansion using basis* $\{\tau_j\}_{j=1}^n$ and h *is supported on* N *in the expansion using basis* $\{\omega_j\}_{j=1}^n$ *, then* $h = 0$ *.*

It is reasonable to ask whether there is a Banach space version of Ghobber-Jaming Uncertainty Principle, which when restricted to Hilbert space, reduces to Theorem [1.2?](#page-1-1) We are going to answer this question in the paper.

2. Functional Ghobber-Jaming Uncertainty Principle

In the paper, K denotes $\mathbb C$ or $\mathbb R$ and X denotes a finite dimensional Banach space over K. Identity operator on X is denoted by $I_{\mathcal{X}}$. Dual of X is denoted by \mathcal{X}^* . Whenever $1 < p < \infty$, q denotes conjugate index of p. For $d \in \mathbb{N}$, the standard finite dimensional Banach space \mathbb{K}^d over \mathbb{K} equipped with standard $\|\cdot\|_p$ norm is denoted by $\ell^p([d])$. Canonical basis for \mathbb{K}^d is denoted by $\{\delta_j\}_{j=1}^d$ and $\{\zeta_j\}_{j=1}^d$ be the coordinate functionals associated with $\{\delta_j\}_{j=1}^d$. Motivated from the properties of orthonormal bases for Hilbert spaces, we set the following notion of p-orthonormal bases which is also motivated from the notion of p-approximate Schauder frames [\[7\]](#page-6-6) and p-unconditional Schauder frames [\[6\]](#page-6-7).

Definition 2.1. Let X be a finite dimensional Banach space over K. Let $\{\tau_j\}_{j=1}^n$ be a basis for X and let $\{f_j\}_{j=1}^n$ be the coordinate functionals associated with $\{\tau_j\}_{j=1}^n$. The pair $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$ is said to *be a* **p-orthonormal basis** $(1 < p < \infty)$ for X if the following conditions hold.

- (i) $||f_j|| = ||\tau_j|| = 1$ *for all* $1 \leq j \leq n$ *.*
- (ii) For every $(a_j)_{j=1}^n \in \mathbb{K}^n$,

$$
\left\| \sum_{j=1}^n a_j \tau_j \right\| = \left(\sum_{j=1}^n |a_j|^p \right)^{\frac{1}{p}}.
$$

Given a p-orthonormal basis $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$, we easily see from Definition [2.1](#page-1-2) that

$$
||x|| = \left\| \sum_{j=1}^n f_j(x)\tau_j \right\| = \left(\sum_{j=1}^n |f_j(x)|^p \right)^{\frac{1}{p}}, \quad \forall x \in \mathcal{X}.
$$

Example 2.2. The pair $({{\zeta}_j}_{j=1}^d, {\delta_j}_{j=1}^d)$ is a p-orthonormal basis for $\ell^p([d])$.

Like orthonormal bases for Hilbert spaces, the following theorem characterizes all p-orthonormal bases.

Theorem 2.3. Let $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$ be a p-orthonormal basis for X. Then a pair $(\{g_j\}_{j=1}^n, \{\omega_j\}_{j=1}^n)$ *is a p-orthonormal basis for* X *if and only if there is an invertible linear isometry* $V : X \to X$ *such that*

$$
g_j = f_j V^{-1}, \ \omega_j = V \tau_j, \quad \forall 1 \le j \le n.
$$

Proof. (\Rightarrow) Define $V : \mathcal{X} \ni x \mapsto \sum_{j=1}^n f_j(x) \omega_j \in \mathcal{X}$. Since $\{\omega_j\}_{j=1}^n$ is a basis for \mathcal{X}, V is invertible with inverse $V^{-1}: \mathcal{X} \ni x \mapsto \sum_{j=1}^n g_j(x)\tau_j \in \mathcal{X}$. For $x \in \mathcal{X}$,

$$
||Vx|| = \left\| \sum_{j=1}^{n} f_j(x)\omega_j \right\| = \left(\sum_{j=1}^{n} |f_j(x)|^p \right)^{\frac{1}{p}} = \left\| \sum_{j=1}^{n} f_j(x)\tau_j \right\| = ||x||.
$$

Therefore V is isometry. Note that we clearly have $\omega_j = V \tau_j, \forall 1 \leq j \leq n$. Now let $1 \leq j \leq n$. Then

$$
f_j(V^{-1}x) = f_j\left(\sum_{k=1}^n g_k(x)\tau_k\right) = \sum_{k=1}^n g_k(x)f_j(\tau_k) = g_j(x), \quad \forall x \in \mathcal{X}.
$$

(\Leftarrow) Since V is invertible, $\{\omega_j\}_{j=1}^n$ is a basis for X. Now we see that $g_j(\omega_k) = f_j(V^{-1}V\tau_k) = f_j(\tau_k) = \delta_{j,k}$ for all $1 \leq j, k \leq n$. Therefore $\{g_j\}_{j=1}^n$ is the coordinate functionals associated with $\{\omega_j\}_{j=1}^n$. Since V is an isometry, we have $\|\omega_j\| = 1$ for all $1 \leq j \leq n$. Since V is also invertible, we have

$$
||g_j|| = \sup_{x \in \mathcal{X}, ||x|| \le 1} |g_j(x)| = \sup_{x \in \mathcal{X}, ||x|| \le 1} |f_j(V^{-1}x)| = \sup_{V y \in \mathcal{X}, ||V y|| \le 1} |f_j(y)|
$$

=
$$
\sup_{V y \in \mathcal{X}, ||y|| \le 1} |f_j(y)| = ||f_j|| = 1, \quad \forall 1 \le j \le n.
$$

Finally, for every $(a_j)_{j=1}^n \in \mathbb{K}^n$,

$$
\left\| \sum_{j=1}^n a_j \omega_j \right\| = \left\| \sum_{j=1}^n a_j V \tau_j \right\| = \left\| V \left(\sum_{j=1}^n a_j \tau_j \right) \right\| = \left\| \sum_{j=1}^n a_j \tau_j \right\| = \left(\sum_{j=1}^n |a_j|^p \right)^{\frac{1}{p}}.
$$

In the next result we show that Example [2.2](#page-2-0) is prototypical as long as we consider p-orthonormal bases.

Theorem 2.4. If X has a p-orthonormal basis $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$, then X is isometrically isomorphic to $\ell^p([n])$.

Proof. Define $V: \mathcal{X} \ni x \mapsto \sum_{j=1}^n f_j(x)\delta_j \in \ell^p([n])$. By doing a similar calculation as in the direct part in the proof of Theorem [2.3,](#page-2-1) we see that V is an invertible isometry. \Box

Now we derive main result of this paper.

Theorem 2.5. *(Functional Ghobber-Jaming Uncertainty Principle)* Let $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$ and $(\{g_k\}_{k=1}^n, \{\omega_k\}_{k=1}^n)$ be p-orthonormal bases for X. If $M, N \subseteq \{1, ..., n\}$ are such that

$$
o(M)^{\frac{1}{q}}o(N)^{\frac{1}{p}}<\frac{1}{\max\limits_{1\leq j,k\leq n}|g_k(\tau_j)|},
$$

then for all $x \in \mathcal{X}$ *,*

$$
(4) \qquad ||x|| \leq \left(1 + \frac{1}{1 - o(M)^{\frac{1}{q}} o(N)^{\frac{1}{p}} \max_{1 \leq j,k \leq n} |g_k(\tau_j)|}\right) \left[\left(\sum_{j \in M^c} |f_j(x)|^p\right)^{\frac{1}{p}} + \left(\sum_{k \in N^c} |g_k(x)|^p\right)^{\frac{1}{p}}\right].
$$

In particular, if x *is supported on* M *in the expansion using basis* $\{\tau_j\}_{j=1}^n$ and x *is supported on* N *in the expansion using basis* $\{\omega_k\}_{k=1}^n$ *, then* $x = 0$ *.*

Proof. Given $S \subseteq \{1, \ldots, n\}$, define

$$
P_Sx\coloneqq\sum_{j\in S}f_j(x)\tau_j,\quad\forall x\in\mathcal{X},\quad\|x\|_{S,f}\coloneqq\left(\sum_{j\in S}|f_j(x)|^p\right)^{\frac{1}{p}},\quad\|x\|_{S,g}\coloneqq\left(\sum_{j\in S}|g_j(x)|^p\right)^{\frac{1}{p}}.
$$

Also define $V: \mathcal{X} \ni x \mapsto \sum_{k=1}^n g_k(x) \tau_k \in \mathcal{X}$. Then V is an invertible isometry. Using V we make following important calculations:

$$
||P_Sx|| = \left\| \sum_{j \in S} f_j(x)\tau_j \right\| = \left(\sum_{j \in S} |f_j(x)|^p\right)^{\frac{1}{p}} = ||x||_{S,f}, \quad \forall x \in \mathcal{X}
$$

and

$$
||P_S Vx|| = \left\| \sum_{j \in S} f_j(Vx)\tau_j \right\| = \left\| \sum_{j \in S} f_j\left(\sum_{k=1}^n g_k(x)\tau_k\right)\tau_j \right\| = \left\| \sum_{j \in S} \sum_{k=1}^n g_k(x)f_j(\tau_k)\tau_j \right\|
$$

$$
= \left\| \sum_{j \in S} g_j(x)\tau_j \right\| = \left(\sum_{j \in S} |g_j(x)|^p\right)^{\frac{1}{p}} = ||x||_{S,g}, \quad \forall x \in \mathcal{X}.
$$

Now let $y \in \mathcal{X}$ be such that $\{j \in \{1, ..., n\} : f_j(y) \neq 0\} \subseteq M$. Then $||P_N V y|| = ||P_N V P_M y|| \leq$ $\|P_N VP_M\| \|y\|$ and

$$
||y||_{N^{c},g} = ||P_{N^{c}}Vy|| = ||Vy - P_{N}Vy|| \ge ||Vy|| - ||P_{N}Vy|| = ||y|| - ||P_{N}Vy|| \ge ||y|| - ||P_{N}VP_{M}||||y||.
$$

Therefore

(5)
$$
||y||_{N^c,g} \ge (1 - ||P_NVP_M||)||y||.
$$

Let $x \in \mathcal{X}$. Note that $P_M x$ satisfies $\{j \in \{1, ..., n\} : f_j(P_M x) \neq 0\} \subseteq M$. Now using [\(5\)](#page-3-0) we get $\|x\| = \|P_Mx + P_{M^c}x\| \le \|P_Mx\| + \|P_{M^c}x\| \le \frac{1}{1 - \|P_NVP_M\|} \|P_Mx\|_{N^c,g} + \|P_{M^c}x\|$

$$
= \frac{1}{1 - ||P_N VP_M||} ||P_{N^c} VP_M x|| + ||P_{M^c} x|| = \frac{1}{1 - ||P_N VP_M||} ||P_{N^c} V(x - P_{M^c} x)|| + ||P_{M^c} x||
$$

\n
$$
\leq \frac{1}{1 - ||P_N VP_M||} ||P_{N^c} V x|| + \frac{1}{1 - ||P_N VP_M||} ||P_{N^c} VP_{M^c} x|| + ||P_{M^c} x||
$$

\n
$$
\leq \frac{1}{1 - ||P_N VP_M||} ||P_{N^c} V x|| + \frac{1}{1 - ||P_N VP_M||} ||P_{M^c} x|| + ||P_{M^c} x||
$$

\n
$$
= \frac{1}{1 - ||P_N VP_M||} ||P_{N^c} V x|| + \left(1 + \frac{1}{1 - ||P_N VP_M||}\right) ||P_{M^c} x||
$$

\n
$$
\leq ||P_{N^c} V x|| + \frac{1}{1 - ||P_N VP_M||} ||P_{N^c} V x|| + \left(1 + \frac{1}{1 - ||P_N VP_M||}\right) ||P_{M^c} x||
$$

\n
$$
= \left(1 + \frac{1}{1 - ||P_N VP_M||}\right) [||P_{N^c} V x|| + ||P_{M^c} x||] = \left(1 + \frac{1}{1 - ||P_N VP_M||}\right) [||x||_{N^c, g} + ||P_{M^c} x||]
$$

\n
$$
= \left(1 + \frac{1}{1 - ||P_N VP_M||}\right) \left[\left(\sum_{j \in M^c} |f_j(x)|^p\right)^{\frac{1}{p}} + \left(\sum_{k \in N^c} |g_k(x)|^p\right)^{\frac{1}{p}}\right].
$$

For $x \in \mathcal{X}$, we now find

$$
||P_N VP_M x||^p = \left\| \sum_{k \in N} f_k (VP_M x) \tau_k \right\|^p = \left(\sum_{k \in N} |f_k (VP_M x)|^p \right)^{\frac{1}{p}} = \sum_{k \in N} \left| (f_k V) \left(\sum_{j \in M} f_j (x) \tau_j \right) \right|^p
$$

\n
$$
= \sum_{k \in N} \left| \sum_{j \in M} f_j (x) f_k (V \tau_j) \right|^p = \sum_{k \in N} \left| \sum_{j \in M} f_j (x) f_k \left(\sum_{r=1}^n g_r (\tau_j) \tau_r \right) \right|^p = \sum_{k \in N} \left| \sum_{j \in M} f_j (x) \sum_{r=1}^n g_r (\tau_j) f_k (\tau_r) \right|^p
$$

\n
$$
= \sum_{k \in N} \left| \sum_{j \in M} f_j (x) g_k (\tau_j) \right|^p \leq \sum_{k \in N} \left(\sum_{j \in M} |f_j (x) g_k (\tau_j) | \right)^p \leq \left(\max_{1 \leq j, k \leq n} |g_k (\tau_j) | \right)^p \sum_{k \in N} \left(\sum_{j \in M} |f_j (x) | \right)^p
$$

\n
$$
= \left(\max_{1 \leq j, k \leq n} |g_k (\tau_j) | \right)^p o(N) \left(\sum_{j \in M} |f_j (x) | \right)^p \leq \left(\max_{1 \leq j, k \leq n} |g_k (\tau_j) | \right)^p o(N) \left(\sum_{j \in M} |f_j (x) |^p \right)^{\frac{p}{p}} \left(\sum_{j \in M} 1^q \right)^{\frac{p}{q}}
$$

\n
$$
\leq \left(\max_{1 \leq j, k \leq n} |g_k (\tau_j) | \right)^p o(N) \left(\sum_{j=1}^n |f_j (x) |^p \right)^{\frac{p}{p}} \left(\sum_{j \in M} 1^q \right)^{\frac{p}{q}} = \left(\max_{1 \leq j, k \leq n} |g_k (\tau_j) | \right)^p o(N) ||x||^p o(M)^{\frac{p}{q}}.
$$

Therefore

$$
||P_N VP_M|| \le \max_{1 \le j,k \le n} |g_k(\tau_j)| o(N)^{\frac{1}{p}} o(M)^{\frac{1}{q}}
$$

which gives the theorem. $\hfill \square$

Corollary 2.6. *Theorem [1.2](#page-1-1) follows from Theorem [2.5.](#page-3-1)*

Proof. Let ${\{\tau_j\}}_{j=1}^n$, ${\{\omega_j\}}_{j=1}^n$ be two orthonormal bases for a finite dimensional Hilbert space H. Define

$$
f_j: \mathcal{H} \ni h \mapsto \langle h, \tau_j \rangle \in \mathbb{K}; \quad g_j: \mathcal{H} \ni h \mapsto \langle h, \omega_j \rangle \in \mathbb{K}, \quad \forall 1 \leq j \leq n.
$$

Then $p = q = 2$ and $|f_j(\omega_k)| = |\langle \omega_k, \tau_j \rangle|$ for all $1 \le j, k \le n$.

By interchanging p-orthonormal bases in Theorem [2.5](#page-3-1) we get the following theorem.

Theorem 2.7. *(Functional Ghobber-Jaming Uncertainty Principle)* Let $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$ and $(\{g_k\}_{k=1}^n, \{\omega_k\}_{k=1}^n)$ *be p-orthonormal bases for* X. If $M, N \subseteq \{1, ..., n\}$ *are such that*

$$
o(M)^{\frac{1}{q}}o(N)^{\frac{1}{p}} < \frac{1}{\max_{1 \le j,k \le n} |f_j(\omega_k)|},
$$

then for all $x \in \mathcal{X}$,

$$
||x|| \leq \left(1 + \frac{1}{1 - o(M)^{\frac{1}{q}} o(N)^{\frac{1}{p}} \max_{1 \leq j,k \leq n} |f_j(\omega_k)|}\right) \left[\left(\sum_{k \in M^c} |g_k(x)|^p\right)^{\frac{1}{p}} + \left(\sum_{j \in N^c} |f_j(x)|^p\right)^{\frac{1}{p}} \right].
$$

In particular, if x *is supported on* M *in the expansion using basis* $\{\omega_k\}_{k=1}^n$ *and* x *is supported on* N *in the expansion using basis* $\{\tau_j\}_{j=1}^n$ *, then* $x = 0$ *.*

Observe that the constant

$$
C_d e^{C_d \min\{m(E)m(F), m(E)^{\frac{1}{d}}w(F), m(F)^{\frac{1}{d}}w(E)\}}
$$

in Inequality [\(2\)](#page-1-3) is depending upon subsets E, F and not on the entire domain R of functions f, \hat{f} . Thus it is natural to ask whether there is a constant sharper in Inequality (4) depending upon subsets M, N and not on $\{1, \ldots, n\}$. A careful observation in the proof of Theorem [2.5](#page-3-1) gives following result.

Theorem 2.8. Let $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$ and $(\{g_k\}_{k=1}^n, \{\omega_k\}_{k=1}^n)$ be p-orthonormal bases for X. If $M, N \subseteq$ $\{1, \ldots, n\}$ *are such that*

$$
o(M)^{\frac{1}{q}}o(N)^{\frac{1}{p}} < \frac{1}{\max_{j \in M, k \in N} |g_k(\tau_j)|},
$$

then for all $x \in \mathcal{X}$ *,*

$$
||x|| \leq \left(1 + \frac{1}{1 - o(M)^{\frac{1}{q}} o(N)^{\frac{1}{p}} \max_{j \in M, k \in N} |g_k(\tau_j)|}\right) \left[\left(\sum_{j \in M^c} |f_j(x)|^p\right)^{\frac{1}{p}} + \left(\sum_{k \in N^c} |g_k(x)|^p\right)^{\frac{1}{p}} \right].
$$

Similarly we have the following result from Theorem [2.7.](#page-4-0)

Theorem 2.9. Let $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$ and $(\{g_k\}_{k=1}^n, \{\omega_k\}_{k=1}^n)$ be p-orthonormal bases for X. If $M, N \subseteq$ $\{1, \ldots, n\}$ *are such that*

$$
o(M)^{\frac{1}{q}}o(N)^{\frac{1}{p}} < \frac{1}{\max\limits_{j \in N, k \in M} |f_j(\omega_k)|},
$$

then for all $x \in \mathcal{X}$ *,*

$$
||x|| \leq \left(1 + \frac{1}{1 - o(M)^{\frac{1}{q}} o(N)^{\frac{1}{p}} \max_{j \in N, k \in M} |f_j(\omega_k)|}\right) \left[\left(\sum_{k \in M^c} |g_k(x)|^p\right)^{\frac{1}{p}} + \left(\sum_{j \in N^c} |f_j(x)|^p\right)^{\frac{1}{p}} \right].
$$

Theorem [2.5](#page-3-1) brings the following question.

Question 2.10. *Given* p and a Banach space X of dimension n, for which subsets $M, N \subseteq \{1, \ldots, n\}$ and pairs of p-orthonormal bases $(\{f_j\}_{j=1}^n, \{\tau_j\}_{j=1}^n)$, $(\{g_k\}_{k=1}^n, {\{\omega_k\}_{k=1}^n})$ for X, we have equality in Inequality *[\(4\)](#page-3-2)?*

It is clear that we used $1 < p < \infty$ in the proof of Theorem [2.5.](#page-3-1) However, Definition [2.1](#page-1-2) can easily be extended to include cases $p = 1$ and $p = \infty$. This therefore leads to the following question.

Question 2.11. *Whether there are Functional Ghobber-Jaming Uncertainty Principle (versions of Theorem [2.5\)](#page-3-1) for 1-orthonormal bases and* ∞*-orthonormal bases?*

We end by mentioning that Donoho-Stark-Elad-Bruckstein-Ricaud-Torrésani Uncertainty Principle for finite dimensional Banach spaces is derived in [\[5\]](#page-6-8) (actually, in [\[5\]](#page-6-8) the functional uncertainty principle was derived for p-Schauder frames which is general than p-orthonormal bases. Thus it is worth to derive Theorem [2.5](#page-3-1) or a variation of it for p-Schauder frames, which we are unable).
