Beavers build their lodges in ponds they have created in wooded areas. Like many things in nature, there is a connection between creatures in the wild. Beaver ponds cause trees to drown, but the dead trees attract the great blue heron, which often return year after year. Over time, a beaver pond can attract more than 50 nests in a colony, called a rookery.

An example of this can be found in the large pond off Bradford Road at Carter Fields near the Boxford line.

Chris Leahy, an expert with the Massachusetts Audubon Society who wrote

people by eating their way through plant-clogged water highways. Plants are hard on teeth, and they're difficult to digest. But sirenians have some special adaptations for dealing with these problems. For example, new teeth move in from the backs of manatees' jaws to take the place of teeth that are worn out. (No other sea mammal can replace its teeth in this way.) And incredibly long intestines—more than 150 feet (45 m) in some sirenians—help in the breakdown of the tough plant fibers that these underwater grazers feed on. Wonderful Whales!

big dams and live in the branches of big dams and live in the water. big trees. They have two different types of teeth. Their teeth are like front teeth and they are used for eating. Beaver teeth are used to clean the fish out of the river, to prepare the food. Their teeth are also used to build their dam. The beaver teeth are used to

gills. The clams eat wood that has made its way to the bottom of the ocean, feasting on trees, logs and manmade wooden objects.

To feed, they flex muscles and rock their shells to grind down the wood. They then eat the sawdust and digest it with special bacteria found in their gills.

“There's not just one tree-cleaner-upper in the ocean, they're really diverse,” said lead author Janet Voight, associate curator of invertebrate zoology at the Field Museum, in a statement, “Imagine living at the bottom of the ocean as a

cut the trees with their sharp teeth and chew the wood with their strong jaws. They build their dams in the branches of big trees. They like to sleep in the dam and they sleep for six months each year. In the spring, beavers go down to the rivers and swim with their big tails.

cut the wood, and it can be used to dig for food, and to build their home. When beavers are happy, they have some kind of singing. When they are angry, they can let their teeth click. They can be aggressive animals, when it comes to their home and when they have their young ones
